

Extending limited in situ mountain weather observations to the baseline climate: A true verification case study

Marlis Hofer and Johannes **Horak**

IMC – 09.09.2019

The Problem

limited observations for **high mountain regions**

The Problem

limited observations for **high mountain regions**

- gaps

The Problem

limited observations for **high mountain regions**

- gaps
- short duration

sDoG

a statistical downscaling tool (linear regression)

combines

- in situ observations with
- global reanalysis datasets

sDoG

a statistical downscaling tool (linear regression)

combines

- in situ observations with
- global reanalysis datasets

Result:

sDoG

a statistical downscaling tool (linear regression)

combines

- in situ observations with
- global reanalysis datasets

Result:

Investigate: **daily mean temperature**

Does sDoG **outperform** selected models?

- ERA-Interim, ERA5, ALARO, ...

Is the estimated **uncertainty reliable**?

Methodology

Full timeseries at Vernagtbachstation (2640 m MSL)
